0 Executive Summary

The Invisible Word-of-Mouth Engine

Traditional growth marketing relies on paid acquisition and feature drops. Our data pipeline reveals that Anthropic (Claude) bypassed this entirely through **product-led viral loops**. Claude's growth is driven by three interlocking mechanics: a release cadence timed against competitor crises, an obsessive focus on **Time-to-Value (TTV)**, and a UI built for distribution (Artifacts).

PILLAR I
Velocity Moat
Acquisition Timing

PILLAR II
TTV Alpha
The Viral Trigger

PILLAR III
Artifacts Loop
Distribution Engine

1 Engineering Pipeline

Building the Ground Truth Dataset

To ensure our insights were impossible to fake, we built a **hybrid classification architecture**. Social media is polluted with AI aggregator bots — we applied a strict 7-rule Bot & Slop filter, removing over 30% of the initial scrape, guaranteeing a 100% human-sentiment corpus.

DATA HYGIENE FILTER	7-rule Bot & Slop filter removed 30%+ of initial scrape. Accounts posting >50×/day eliminated.
MANUAL SIEVE	Top 50 highest-engagement posts read manually to identify "North Star" phrasings — e.g., "10× faster," "done with chatgpt."
AGENT 1 — LLM CLASSIFIER	22,000+ posts evaluated against a strict JSON schema identifying TTV_Delta, Artifact_Signals, and Aha_Moments.

2 Pillar I — The Velocity Moat

Acquisition Timing as Primary Channel

THE INSIGHT

Anthropic's release cadence is its primary acquisition channel, weaponized against competitor missteps.

Our "Velocity Moat" analysis tracks the volume of **"ChatGPT Refugee"** posts over time. Major Anthropic releases correlate perfectly with massive spikes in users publicly migrating from OpenAI. Users rarely switch due to a single feature — they switch due to **trust erosion and competitor disappointment**, followed immediately by an Anthropic release acting as a safe haven.

TOP REFUGEE TRIGGER POSTS — BY ENGAGEMENT

RANK	ENGAGEMENT	EXCERPT
#01	31,929	"OpenAI just made a deal with a devil... Sam Altman decided defense money was more important... Cancel Plus right n
#30	2,325	"The body wasn't even cold before OpenAI signed a deal to deploy on classified Department of War networks."

FIGURE 1 — THE "VELOCITY MOAT"

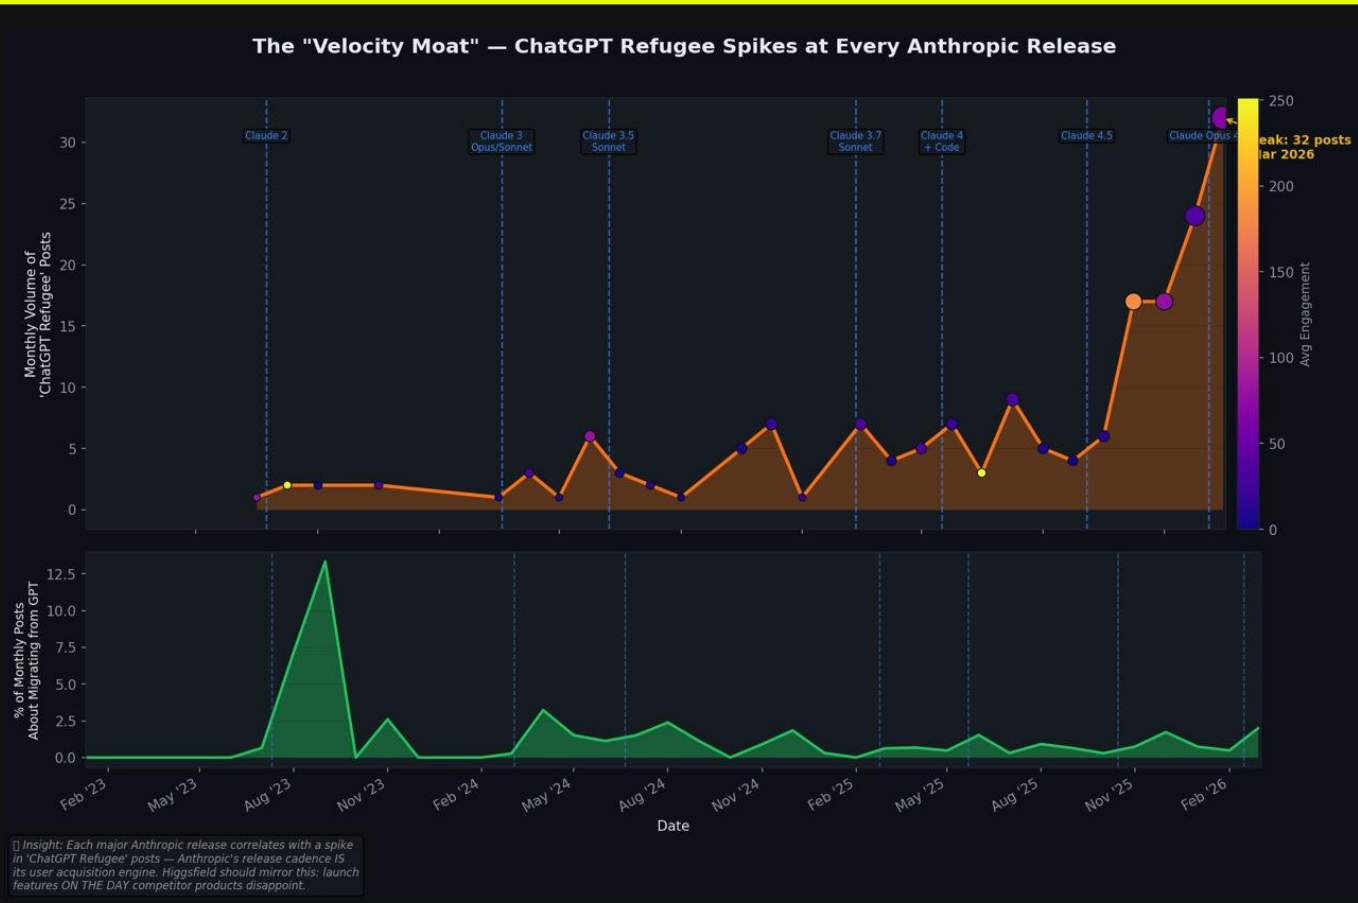

Figure 1. The "Velocity Moat" — ChatGPT Refugee Spikes at Every Anthropic Release

HIGGSFIELD PLAY

Market timing beats product superiority. Monitor competitor release failures (Runway Gen-3 rate limits, Sora delays, Kling censorship). When user sentiment dips, deploy a "Come Try Diffuse" campaign within 4 hours.

3 Pillar II — The TTV Alpha

Efficiency is Mathematically More Viral Than Excellence

THE INSIGHT

Speed-focused posts generate 1.7× more engagement than quality-focused posts.

TTV vs. ENGAGEMENT MATRIX

Quality-Focused
41 avg. engagement · Baseline

Speed-Focused
72 avg. engagement · 1.7× Lift

FIGURE 2 — TTV vs. ENGAGEMENT MATRIX

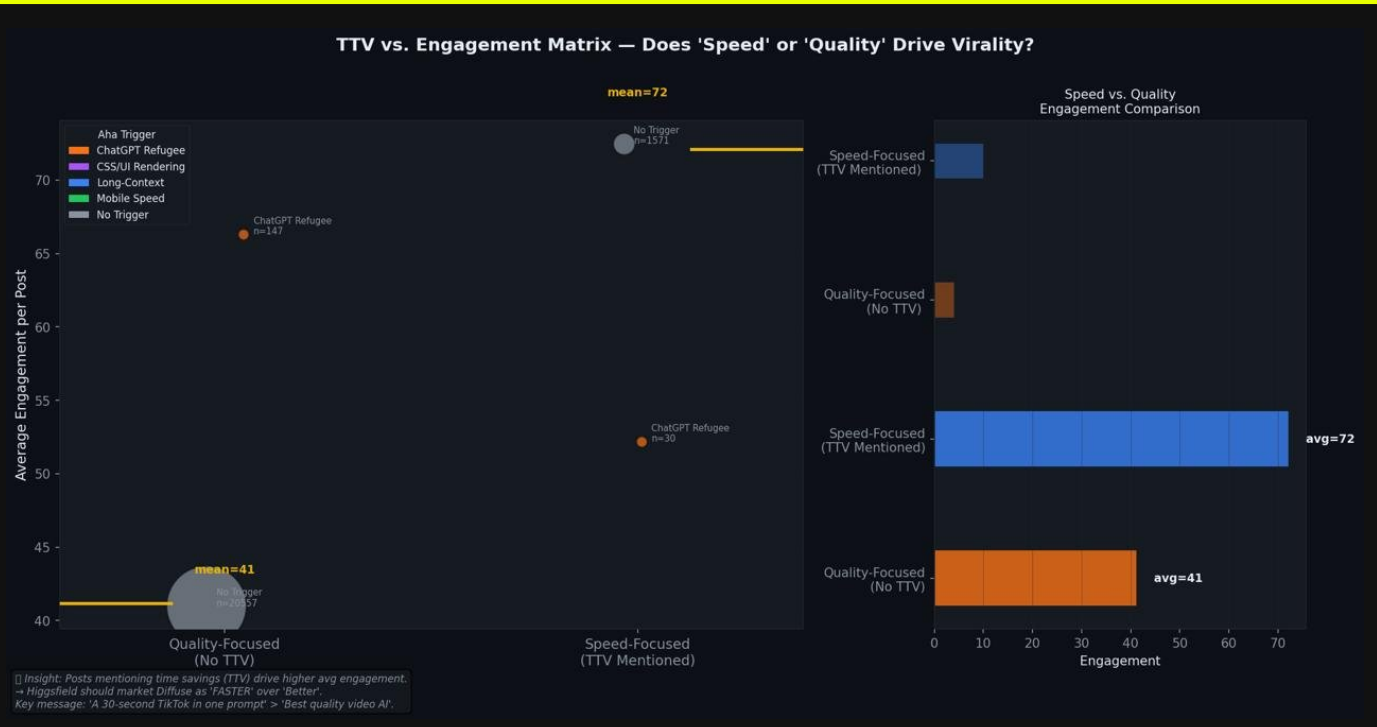

Figure 2. TTV vs. Engagement Matrix — Does 'Speed' or 'Quality' Drive Virality?

The Psychological Mechanic: When a user shares a high-quality output, the audience attributes it to the creator's skill — hard to copy. When a user shares a high-speed output, the audience attributes it to the **tool** — easy to adopt. The shortcut gets rewarded with massive engagement.

HIGGSFIELD PLAY

Quality is a commodity; time is a currency. Every piece of Diffuse marketing must lead with a time claim. Do not market "Beautiful AI video." Market "A 30-second TikTok in one prompt. No skills required."

4 Pillar III — The Artifacts Loop

The Product Output Must Become the Advertisement

THE INSIGHT

It is much easier for a user to share a result than to articulate a benefit.

SIGNAL PENETRATION FUNNEL

SIGNAL	CORPUS PENETRATION	ENGAGEMENT LIFT
Artifacts / Remix Signal	9.3% of corpus	**1.5× over no-artifact posts**
TTV Delta Mentioned	7.2% of corpus	**1.8× over no-TTV posts**

FIGURE 3 — THE "REMIX RATE" FUNNEL

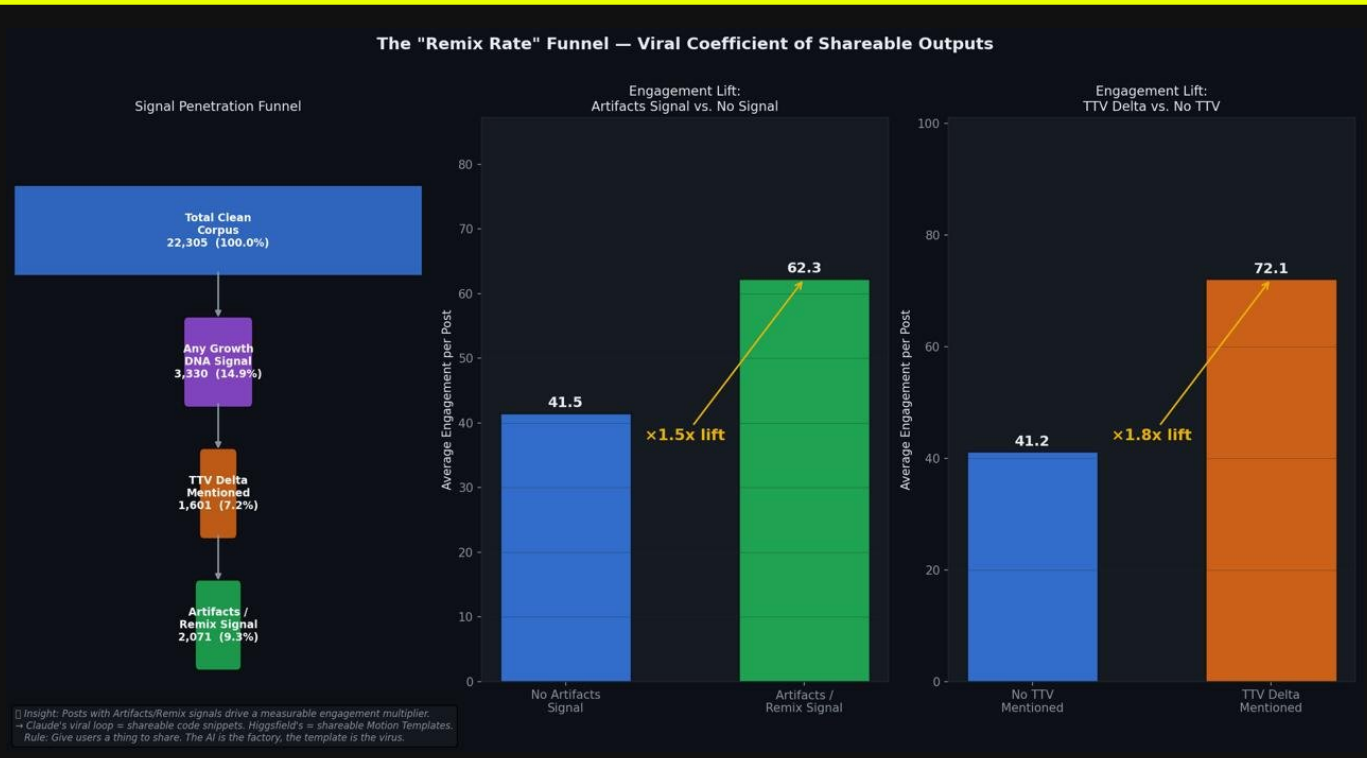

Figure 3. The "Remix Rate" Funnel — Viral Coefficient of Shareable Outputs

The Deep Architectural Pattern: Claude won because it gave users tangible utility — code snippets, GitHub repos — to share with their networks. It turned the consumer into a distributor. Sharing a result requires zero effort; articulating a benefit requires thought.

> **HIGGSFIELD PLAY**
> Build a Video Template Viral Loop. The shareable artifact is not the final video — it is the "Motion Template." Let viewers remix the camera path in 1-click. The template is the virus.

5 Engineering Tradeoffs

Architectural Decisions & Calculated Costs

DECISION	COST	GAIN
Strict Slop Filtering vs. Volume	Aggressively filtered news aggregators — lost minor news-cycle data.	Guaranteed 100% human-sentiment corpus for the LLM to analyze.

LLM Classification vs. Regex	Used Agent 1 to classify intent rather than simple keyword matching.	Higher compute cost. Captured nuanced Aha Moments regex would miss.
Engagement as Virality Proxy	Measured success by engagement scores (Likes + Comments) vs. conversions.	High engagement does not guarantee retention, but is the definitive ToFu metric.
